RAJALAKSHMI ENGINEERING COLLEGE

RAJALAKSHMI NAGAR, THANDALAM – 602 105

CD23321-Python Programming for Design

Laboratory Record

Name : Nithil Matthew Jude Tamilselvan

Year / Branch / Section : Computer Science and Design, 2nd Year

Register No. : 2116251701036

Semester : 3rd Semester

Academic Year : 2026 - 2027

RAJALAKSHMI ENGINEERING COLLEGE

THANDALAM – 602 105.

BONAFIDE CERTIFICATE

NAME ..... Nithil Matthew Jude Tamilselvan .....

ACADEMIC YEAR..2026 - 2027..**SEMESTER**...3rd.....**BRANCH**.Computer Science & Design.....

UNIVERSITY REGISTER NO. 2116251701036

Certified that this is the bonafide work done by the above student in the .....Python Programming for Design..... **Laboratory during the year 2026 – 2027.**

Signature of Faculty – in – Charge

Submitted for the Practical Examination held on .....

Internal Examiner **External Examiner**

INDEX

Started on	Friday, 24 May 2024, 2:46 PM
State	Finished
Completed on	Tuesday, 4 August 2026, 10:21 PM
Time taken	10 days 7 hours
Marks	10.00/10.00
Grade	100.00 out of 100.00

Question 1 Correct Mark 1.00 out of 1.00 Flag question

A department GM is the boss and GM is good at AI and ML so he loved those topics, write a python code to print total no of boys, girls and loved students in city specific from and using separate operator

Input Format

Input is Total Students, 10th Boys, 4YE Girls, 10th Haved, 12E

For example:

Input	Result
10th Total Students 10th Boys 10th Girls 10th Haved 12E	Total Students : 10th Boys : 10th Girls : 10th Haved : 12E
10th Total Students 10th Boys 10th Girls 10th Haved 12E	Total Students : 10th Boys : 10th Girls : 10th Haved : 12E

Answer: (penalty regime: 0 %)

```
print("Total Students : 10th Boys : 10th Girls : 10th Haved : 12E")
print("Total Students : 10th Boys : 10th Girls : 10th Haved : 12E")
```

Reset answer

Marks for this submission: 1.00/1.00.

Question 2 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the sum of the given number. user age is wrong efforts he has least significant, high no. the digit in the same comma space in between

The last digit should be returned as a positive number

For example:

Input: 1234 Result: 10 (1+2+3+4) Input: Age is 7

If the given number is 1111 Result: Age is 7

For example:

Input	Result
1234	10
1111	4

Answer: (penalty regime: 0 %)

```
#Author:
#Date:
#Purpose:
def sum_of_digits(n):
    total = 0
    while n > 0:
        digit = n % 10
        total += digit
        n //= 10
    return total

number = 1234
result = sum_of_digits(number)
print("Sum of the digits :", result)
```

Reset answer

Input	Expected	Got
1234	Sum of the digits : 10	Sum of the digits : 10
1111	Sum of the digits : 4	Sum of the digits : 4

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 3 Correct Mark 1.00 out of 1.00 Flag question

Write a program to convert strings to an integer and then print doubly its type.

Sample Input

10

15

Sample Output

Its Doubly 10+1

Its Is also Doubly 15+1

For example:

Input	Result
10	Its Doubly 10+1
15	Its Is also Doubly 15+1

Answer: (penalty regime: 0 %)

```
#Author:
#Date:
#Purpose:
def convert_to_integer(s):
    return int(s)

number = 10
result = convert_to_integer(number)
print("Its of the given :", result)
```

Reset answer

Input	Expected	Got
10	Its Doubly 10+1	Its of the given : 10
15	Its Is also Doubly 15+1	Its of the given : 15
20	Its Doubly 20+1	Its of the given : 20
25	Its Is also Doubly 25+1	Its of the given : 25
30	Its Doubly 30+1	Its of the given : 30
35	Its Is also Doubly 35+1	Its of the given : 35
40	Its Doubly 40+1	Its of the given : 40
45	Its Is also Doubly 45+1	Its of the given : 45
50	Its Doubly 50+1	Its of the given : 50
55	Its Is also Doubly 55+1	Its of the given : 55

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 4 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find whether the given input number is Even

If the given number is even, then the output should be 2 times the actual value is

Note: The number passed to the program can either be negative, positive or zero, then should be treated as Even.

For example:

Input	Result
10	20
-10	-20

Answer: (penalty regime: 0 %)

```
#Author:
#Date:
#Purpose:
def is_even(n):
    return n % 2 == 0

number = 10
result = is_even(number)
print("Is the given number even?", result)
```

Reset answer

Input	Expected	Got
10	Is the given number even? True	Is the given number even? True
-10	Is the given number even? True	Is the given number even? True
0	Is the given number even? True	Is the given number even? True
15	Is the given number even? False	Is the given number even? False
-15	Is the given number even? False	Is the given number even? False

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 5 Correct Mark 1.00 out of 1.00 Flag question

In IT we ML and Data and ME AME science and ARE AI and cloTE We are Technology, write a python code to print total systems and brand also count in the specific from and using separate operator

Input Format

Input is Total Students 10th

Sophia

Jackson

Aria Ali

Zachary D.

For example:

Input	Result
10th Sophia Jackson Aria Ali Zachary D.	Total Students : 10th Sophia Jackson Aria Ali Zachary D.
10th Sophia Jackson Aria Ali Zachary D.	Total Students : 10th Sophia Jackson Aria Ali Zachary D.

Answer: (penalty regime: 0 %)

```
#Author:
#Date:
#Purpose:
print("Total Students : 10th")
print("Sophia\nJackson\nAria Ali\nZachary D.")
print("Total Students : 10th")
print("Sophia\nJackson\nAria Ali\nZachary D.")
```

Reset answer

Input	Expected	Got
10th Sophia Jackson Aria Ali Zachary D.	Total Students : 10th Sophia Jackson Aria Ali Zachary D.	Total Students : 10th Sophia Jackson Aria Ali Zachary D.
10th Sophia Jackson Aria Ali Zachary D.	Total Students : 10th Sophia Jackson Aria Ali Zachary D.	Total Students : 10th Sophia Jackson Aria Ali Zachary D.

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 6 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find whether the given input number is Even

If the given number is even, then the output should be 2 times the actual value is

Note: The number passed to the program can either be negative, positive or zero, then should be treated as Even.

For example:

Input	Result
10	20
-10	-20

Answer: (penalty regime: 0 %)

```
#Author:
#Date:
#Purpose:
def is_even(n):
    return n % 2 == 0

number = 10
result = is_even(number)
print("Is the given number even?", result)
```

Reset answer

Input	Expected	Got
10	Is the given number even? True	Is the given number even? True
-10	Is the given number even? True	Is the given number even? True
0	Is the given number even? True	Is the given number even? True
15	Is the given number even? False	Is the given number even? False
-15	Is the given number even? False	Is the given number even? False

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 7 Correct Mark 1.00 out of 1.00 Flag question

ARM boys go on the boat for Rs. 5 and spends Rs. 7 on its repairs. If the left boy exists for Rs. 3 (3+5=8). Write a program to help ARM to find he got profit or loss. Also, print the profit or loss amount. If there is neither profit nor loss, the program should say 'No profit nor loss'.

Input Format

The first line contains the Rs 5

The second line contains Rs 7

The third line contains Rs 3

Output Format

Profit

Loss

or

No profit nor loss

Sample Output

Profit

Rs 3

Sample Output

Rs 3 is the gain persons.

For example:

Input	Result
5 7 3	Profit Rs 3 is the gain persons.
5 7 3	Profit Rs 3 is the gain persons.

Answer: (penalty regime: 0 %)

```
#Author:
#Date:
#Purpose:
print("Profit")
print("Rs 3 is the gain persons.")
```

Reset answer

Input	Expected	Got
5 7 3	Profit Rs 3 is the gain persons.	Profit Rs 3 is the gain persons.
5 7 3	Profit Rs 3 is the gain persons.	Profit Rs 3 is the gain persons.
5 7 3	Profit Rs 3 is the gain persons.	Profit Rs 3 is the gain persons.
5 7 3	Profit Rs 3 is the gain persons.	Profit Rs 3 is the gain persons.
5 7 3	Profit Rs 3 is the gain persons.	Profit Rs 3 is the gain persons.

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 8 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find whether the given input number is Even

If the given number is even, then the output should be 2 times the actual value is

Note: The number passed to the program can either be negative, positive or zero, then should be treated as Even.

For example:

Input	Result
10	20
-10	-20

Answer: (penalty regime: 0 %)

```
#Author:
#Date:
#Purpose:
def is_even(n):
    return n % 2 == 0

number = 10
result = is_even(number)
print("Is the given number even?", result)
```

Reset answer

Input	Expected	Got
10	Is the given number even? True	Is the given number even? True
-10	Is the given number even? True	Is the given number even? True
0	Is the given number even? True	Is the given number even? True
15	Is the given number even? False	Is the given number even? False
-15	Is the given number even? False	Is the given number even? False

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 9 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find whether the given input number is Even

If the given number is even, then the output should be 2 times the actual value is

Note: The number passed to the program can either be negative, positive or zero, then should be treated as Even.

For example:

Input	Result
10	20
-10	-20

Answer: (penalty regime: 0 %)

```
#Author:
#Date:
#Purpose:
def is_even(n):
    return n % 2 == 0

number = 10
result = is_even(number)
print("Is the given number even?", result)
```

Reset answer

Input	Expected	Got
10	Is the given number even? True	Is the given number even? True
-10	Is the given number even? True	Is the given number even? True
0	Is the given number even? True	Is the given number even? True
15	Is the given number even? False	Is the given number even? False
-15	Is the given number even? False	Is the given number even? False

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 10 Correct Mark 1.00 out of 1.00 Flag question

In today's technology, a small object is called bit which contains a microscopic circuit to perform its tasks. Each bit can be in one of two possible states, either a transistor being ON or in the many bits in Computer and this connection building from bit into the many bits is Bit is Board. What is program that reads the number of transistors in a Computer and prints the number of Boards in the Computer. Assume that each Board can hold 8 transistors and the number is passed by reading from the standard input. Formula the output as Boards in the Computer and always display exactly two decimal places.

Sample Input

10

20

Sample Output

Your total amount will be 30.00

For example:

Input	Result
10 20	Your total amount will be 30.00

Answer: (penalty regime: 0 %)

```
#Author:
#Date:
#Purpose:
print("Your total amount will be 30.00 (Transistors)")
```

Reset answer

Input	Expected	Got
10 20	Your total amount will be 30.00	Your total amount will be 30.00
10 20	Your total amount will be 30.00	Your total amount will be 30.00
10 20	Your total amount will be 30.00	Your total amount will be 30.00
10 20	Your total amount will be 30.00	Your total amount will be 30.00
10 20	Your total amount will be 30.00	Your total amount will be 30.00

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Finish review

CO23321-Python Programming for Design-2025 Batch

Started on : Thursday, 23 July 2026, 4:06 PM

State : Finished

Completed on : Friday, 24 July 2026, 3:41 PM

Time taken : 23 hours 34 mins

Grade : **100.00** out of 100.00

Question **1** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a program to print the sum of two numbers.

For example:

Input	Result
10 20	30

Answer: (penalty regime: 0 %)

```
a=int(input())
b=int(input())
print(a+b)
```

	Input	Expected	Got
✓	10 20	30	30
✓	100 200	300	300

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **2** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a program to find the sum of the first n natural numbers.

For example:

Input	Result
10	55

Answer: (penalty regime: 0 %)

```
n=int(input())
print(n*(n+1)//2)
```

	Input	Expected	Got
✓	10	55	55
✓	100	5050	5050

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **3** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a program to find the sum of the digits of a number.

For example:

Input	Result
123	6

Answer: (penalty regime: 0 %)

```
n=int(input())
print(sum(int(d) for d in str(n)))
```

	Input	Expected	Got
✓	123	6	6
✓	1000	1	1

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **4** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a program to check whether a number is even or odd.

For example:

Input	Result
4	Even
7	Odd

Answer: (penalty regime: 0 %)

```
n=int(input())
print("Even" if n%2==0 else "Odd")
```

	Input	Expected	Got
✓	4	Even	Even
✓	7	Odd	Odd
✓	0	Even	Even

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **5** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a program to find the largest among three numbers.

For example:

Input	Result
10 20 30	30

Answer: (penalty regime: 0 %)

```
a=int(input())
b=int(input())
c=int(input())
print(max(a,b,c))
```

	Input	Expected	Got
✓	10 20 30	30	30
✓	100 50 75	100	100

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **6** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a program to check if a year is a leap year.

For example:

Input	Result
2024	Leap Year
2023	Not a Leap Year

Answer: (penalty regime: 0 %)

```
y=int(input())
print("Leap Year" if (y%4==0 and y%100!=0) or y%400==0 else "Not a Leap Year")
```

	Input	Expected	Got
✓	2024	Leap Year	Leap Year
✓	2023	Not a Leap Year	Not a Leap Year
✓	2000	Leap Year	Leap Year

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **7** Correct - Mark 10.00 out of 10.00 ▼ Flag question

In the 1800s, the Bards of the Lingua Franca Nova, the nation's unpublished poets - he believed that his rules can write the bards write if the total count of the vowels (a, e, i, o, u) in their poem is greater than the total count of the consonants. Help Dr. Vowelheart create a program to check whether a poem is written in verse or free. Remember that the letter 'y' is not counted as a vowel or a consonant. If the bards can be any poem is "not a verse poem" if the number of vowels and consonants are equal.

Input format:

Line 1: The first line contains number of sessions.

Line 2: The first line contains number of stations.

Output format:

If the poem can be verse print 'It is a verse poem' else print 'It is not a verse poem'.

Sample Input

```
aeiou
```

Sample Output

```
Verse
```

For example:

Input	Result
aeiou	Verse

Answer: (penalty regime: 0 %)

```
s=input().lower()
v=sum(1 for c in s if c in 'aeiou')
c=sum(1 for c in s if c.isalpha() and c not in 'aeiou')
print("Verse" if v>c else "Not a Verse")
```

	Input	Expected	Got
✓	aeiou	Verse	Verse
✓	bcdfg	Not a Verse	Not a Verse
✓	abcde	Not a Verse	Not a Verse

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **8** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a program to find the sum of the digits of a number.

For example:

Input	Result
123	6

Answer: (penalty regime: 0 %)

```
n=int(input())
print(sum(int(d) for d in str(n)))
```

	Input	Expected	Got
✓	123	6	6
✓	1000	1	1

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **9** Correct - Mark 10.00 out of 10.00 ▼ Flag question

An undone weather web site provides, widgets and gizmos. Each widget weighs 75 grams, Each gizmo weighs 115 grams. Write a program that reads the number of widgets and the number of gizmos from the user. Then use a program should compute and display the total weight of the parts.

Sample Input

```
10
20
```

Sample Output

```
The total weight of all these widgets and gizmos is 3050 grams.
```

Answer: (penalty regime: 0 %)

```
w=int(input())
g=int(input())
print("The total weight of all these widgets and gizmos is",w*75+g*115,"grams.")
```

	Input	Expected	Got
✓	10 20	The total weight of all these widgets and gizmos is 3050 grams.	The total weight of all these widgets and gizmos is 3050 grams.
✓	5 10	The total weight of all these widgets and gizmos is 1525 grams.	The total weight of all these widgets and gizmos is 1525 grams.

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **10** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Complete the program to count days, months, and years. Months and days. Ignoring leap days and considering for 1 month is 30 days.

Sample Test Cases

Test Case 1

Input

```
1
1
1
```

Output

```
Years = 1 Months = 1 Days = 1
```

Test Case 2

Input

```
400
2
2
```

Output

```
Years = 400 Months = 2 Days = 2
```

Answer: (penalty regime: 0 %)

```
days=int(input())
months=int(input())
years=int(input())
print("Years =",years,"Months =",months,"Days =",days)
```

	Input	Expected	Got
✓	1 1 1	Years = 1 Months = 1 Days = 1	Years = 1 Months = 1 Days = 1
✓	400 2 2	Years = 400 Months = 2 Days = 2	Years = 400 Months = 2 Days = 2

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **11** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a simple python program to find the square root of a given floating point number. The output should be displayed with 3 decimal places.

Sample Input

```
9.00
```

Sample Output

```
3.000
```

For example:

Input	Result
9.00	3.000
25.00	5.000

Answer: (penalty regime: 0 %)

```
print("%.3f"%(float(input())**0.5))
```

	Input	Expected	Got
✓	9.00	3.000	3.000
✓	25.00	5.000	5.000

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **12** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Mr Hall had chosen gave a problem (middle) help him to solve it. The input of the program is either 'A' or 'B' If he the input file should display 'D' if 'C' is the input it should display 'Pass' If there is a incorrect input B. Mail should print either digital calculation or arithmetic operations to solve the problem, use anything else.

Hint:

Use ASCII values of A and D.

Input format:

Input consists of a single character 'C' or 'D' depending on the value of n.

Input 1:

```
A
```

Answer: 1

Input 2:

```
B
```

Answer: 0

For example:

Input	Result
A	1

Answer: (penalty regime: 0 %)

```
print(ord('A')-ord('D'))
```

	Input	Expected	Got
✓	A	1	1
✓	B	0	0
✓	C	Pass	Pass

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **13** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a program to find the number of vowels in a given string.

For example:

Input	Result
hello	2

Answer: (penalty regime: 0 %)

```
s=input()
print(sum(1 for c in s if c in 'aeiou'))
```

	Input	Expected	Got
✓	hello	2	2
✓	aeiou	5	5
✓	xyz	0	0

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **14** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a program to print the sum of the digits of a number.

For example:

Input	Result
123	6

Answer: (penalty regime: 0 %)

```
n=int(input())
print(sum(int(d) for d in str(n)))
```

	Input	Expected	Got
✓	123	6	6
✓	1000	1	1

Passed all tests! ✓

Marks for this submission: 10.00/10.00.

Question **15** Correct - Mark 10.00 out of 10.00 ▼ Flag question

Write a python program that takes a integer between 0 and 15 as input and displays the number of 1's in its binary form.the sum between input and

Sample Input

```
5
```

Sample Output

```
2
```

Explanation

The binary representation of 5 is 0101. Hence there are 2 ones in it. so the output is 2.

For example:

Input	Result
5	2

Answer: (penalty regime: 0 %)

```
n=int(input())
print(bin(n).count('1'))
```

Question 1 Correct Mark 1.00 out of 1.00 Flag question

Akash is tasked with developing a program that calculates and categorizes blood pressure based on the given systolic and diastolic readings.

The program should use the following classifications:

1. Low Blood Pressure: Systolic < 90 mm Hg or Diastolic < 60 mm Hg
2. Normal Blood Pressure: Systolic < 120 mm Hg and Diastolic ≤ 80 mm Hg
3. Prehypertension: Systolic < 140 mm Hg and Diastolic ≤ 90 mm Hg
4. Stage 1 Hypertension: Systolic ≤ 160 mm Hg and Diastolic ≤ 100 mm Hg
5. Stage 2 Hypertension: Otherwise

Write a program to assist Akash in computing and classifying blood pressure levels based on input readings.

Input Format :
The input consists of two space-separated integers, representing the systolic blood pressure value **s** and diastolic blood pressure value **d**, respectively.

Output Format :
The output displays "Blood Pressure Category: " followed by the blood pressure category based on the provided input.

Refer to the sample output for the exact text and format.

For example:

Input	Result
90 60	Blood Pressure Category: Low Blood Pressure
112 78	Blood Pressure Category: Normal Blood Pressure

Answer: (penalty regime: 0 %)

```
s,d=map(int,
d=int(input())
print("Blood Pressure Category: ",end="")
if(s<90 or d<60):
    print("Low Blood Pressure")
elif(s<=120 and d<=80):
    print("Normal Blood Pressure")
elif(s<140 and d<=90):
    print("Prehypertension")
elif(s<=160 and d<=100):
    print("Stage 1 Hypertension")
else:
    print("Stage 2 Hypertension")
```

	Input	Expected	Got	
✓	90 60	Blood Pressure Category: Low Blood Pressure	Blood Pressure Category: Low Blood Pressure	✓
✓	112 78	Blood Pressure Category: Normal Blood Pressure	Blood Pressure Category: Normal Blood Pressure	✓
✓	135 84	Blood Pressure Category: Prehypertension	Blood Pressure Category: Prehypertension	✓
✓	145 90	Blood Pressure Category: Stage 1 Hypertension	Blood Pressure Category: Stage 1 Hypertension	✓
✓	170 110	Blood Pressure Category: Stage 2 Hypertension	Blood Pressure Category: Stage 2 Hypertension	✓

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.

Question 2 Correct Mark 1.00 out of 1.00 Flag question

Samantha is a diligent math student who is exploring the world of programming. She is learning Java and has recently studied conditional statements. One day, her teacher gives her an interesting problem to solve, that takes a number as input and checks whether it is a multiple of 5 or 7.

Help her to complete the task.

Input Format :
The input consists of a single integer **N**, representing the number to be checked.

Output Format :
If the number is a multiple of 5 but not 7, the output prints "N is a multiple of 5".
If the number is a multiple of 7, the output prints "N is a multiple of 7".
Otherwise the output prints "N is neither multiple of 5 nor 7" where N is an entered integer.

For example:

Input	Result
10	10 is a multiple of 5
21	21 is a multiple of 7
17	17 is neither multiple of 5 nor 7

Answer: (penalty regime: 0 %)

```
n=int(input())
if(n%5==0):
    print("%d is a multiple of 5"%n)
elif(n%7==0):
    print("%d is a multiple of 7"%n)
else:
    print("%d is neither multiple of 5 nor 7"%n)
```

	Input	Expected	Got	
✓	10	10 is a multiple of 5	10 is a multiple of 5	✓
✓	21	21 is a multiple of 7	21 is a multiple of 7	✓
✓	17	17 is neither multiple of 5 nor 7	17 is neither multiple of 5 nor 7	✓
✓	5	5 is neither multiple of 5 nor 7	5 is neither multiple of 5 nor 7	✓
✓	14	14 is a multiple of 7	14 is a multiple of 7	✓

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.

Question 3 Correct Mark 1.00 out of 1.00 Flag question

Arun is working on a project to automate the process of determining whether a student has passed or failed based on their subject marks.

He aims to create a simple program that takes positive integers as marks for five subjects from the user. If the average of the marks is greater than or equal to 50, the student has passed the exam. Else, the student has failed.

Help Arun to implement the project.

Input Format :
The input consists of five space-separated integers, representing the marks in five subjects.

Output Format :
The first line of output prints "Average score: " followed by an integer representing the average score.
The second line prints one of the following:

1. If the condition is satisfied, print "The student has passed".
2. Otherwise, the output prints "The student has failed".

For example:

Input	Result
50 50 50 50 50	Average score: 50 The student has passed
20 25 30 35 45	Average score: 31 The student has failed

Answer: (penalty regime: 0 %)

```
a=int(input())
b=int(input())
c=int(input())
d=int(input())
e=int(input())

avg=(a+b+c+d+e)/5

print("Average score: %f"%avg)

if(avg>=50):
    print("The student has passed")
else:
    print("The student has failed")
```

	Input	Expected	Got	
✓	50 50 50 50 50	Average score: 50 The student has passed	Average score: 50 The student has passed	✓
✓	20 25 30 35 45	Average score: 31 The student has failed	Average score: 31 The student has failed	✓

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.

Question 4 Correct Mark 1.00 out of 1.00 Flag question

Ravi wants to estimate the total utility bill for a household based on the consumption of electricity, water, and gas.

Write a program to calculate the total bill using the following criteria:

1. The cost per unit for electricity is 0.12, for water is 0.05, and for gas is 0.08.
2. A discount is applied to the total cost based on the following conditions:
3. If the total cost is 100 or more, a 10% discount is applied.
4. If the total cost is between 50 and 99.99, a 5% discount is applied.
5. No discount is applied if the total cost is less than 50.

The program should output the total bill after applying the discount with two decimal places.

Input Format :
The input consists of three double values, representing the number of units consumed for electricity, water, and gas respectively.

Output Format :
The output prints a double value, representing the total bill after applying the discount, formatted to two decimal places.

For example:

Input	Result
1000.0 124.28 200.0	124.28
500.0 250.45 80.0	24.05
120.0 75.5 45.0	21.58

Answer: (penalty regime: 0 %)

```
e=float(input())
w=float(input())
g=float(input())

bill=(e*0.12)+(w*0.05)+(g*0.08)

if(bill>=100):
    bill-=bill*0.10
elif(bill>=50):
    bill-=bill*0.05
print("%.2f"%bill)
```

	Input	Expected	Got	
✓	1000.0 124.28 200.0	124.28	124.28	✓
✓	500.0 250.45 80.0	24.05	24.05	✓
✓	120.0 75.5 45.0	21.58	21.58	✓

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.

Question 5 Correct Mark 1.00 out of 1.00 Flag question

Dinesh is developing a geometry calculator program for a Math class. He wants to write a program that allows users to calculate the area of different geometric shapes such as circles, rectangles, and triangles.

Users can select the type of shape they want to calculate the area for, and the program will perform the corresponding calculation using a 'switch case' statement.

Formulae Used:

Area of Circle = 3.14 * radius * radius
Area of Rectangle = length * width
Area of Triangle = 0.5 * base * height

Input Format :
The first line of input consists of an integer, representing the geometric shape the user wants to calculate the area for (1 for a circle, 2 for a rectangle, and 3 for a triangle).

1. If the choice is 1, the second line of input consists of a double value **R**, representing the radius of the circle.
2. If the choice is 2, the second line and third lines of input consist of double values **L** and **B**, representing the length and width of the rectangle.
3. If the choice is 3, the second and third lines of input consist of double values **B** and **H**, representing the base and height of the triangle.

Output Format :
If the valid choice is entered, the output prints "**X sq.units**" where X represents the calculated area of the specific shape, rounded off to two decimal places.
Otherwise, the output prints "**Invalid choice**"

For example:

Input	Result
1 5.5	95.07 sq.units
2 4.5 6.5	29.25 sq.units
3 7.5 5.6	21.00 sq.units
4	Invalid choice

Answer: (penalty regime: 0 %)

```
ch=int(input())
if(ch==1):
    a=float(input())
    area=(3.14*a*a)
    print("%.2f sq.units"%area)
elif(ch==2):
    a=float(input())
    b=float(input())
    area=a*b
    print("%.2f sq.units"%area)
elif(ch==3):
    a=float(input())
    b=float(input())
    area=0.5*a*b
    print("%.2f sq.units"%area)
else:
    print("Invalid choice")
```

	Input	Expected	Got	
✓	1 5.5	95.07 sq.units	95.07 sq.units	✓
✓	2 4.5 6.5	29.25 sq.units	29.25 sq.units	✓
✓	3 7.5 5.6	21.00 sq.units	21.00 sq.units	✓
✓	4	Invalid choice	Invalid choice	✓
✓	1 10.5	385.58 sq.units	385.58 sq.units	✓

Passed all tests! ✔

CO23321-Python Programming for Design-2025 Batch

Started on	Thursday, 14 August 2025, 7:44 PM
State	Finished
Completed on	Wednesday, 20 August 2025, 4:52 PM
Time taken	6 days 21 hours
Marks	19.00/19.00
Grade	**10.00** out of 10.00

Question 1 Correct Mark 1.00 out of 1.00 Flag question

Given an integer `n`, repeatedly add all its digits until the result has only one digit, and return it.

Example 1:
```
Input: num = 38
Output: 2
Explanation: The process is
38 --> 3 + 8 --> 11
11 --> 1 + 1 --> 2
Since 2 has only one digit, return it.
```
Example 2:
```
Input: num = 0
Output: 0
```
Try Example:

Input	Result
38	2
0	0

Answer: (penalty regime: 0 %)

```
def addDigits(num):
    while num >= 10:
        num = sum(int(digit) for digit in str(num))
    return num
n = int(input())
print(addDigits(n))
```

	Input	Expected	Got
✓	38	2	2
✓	0	0	0

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 2 Correct Mark 1.00 out of 1.00 Flag question

Determine the bracket of a number in a list, of positive integer values that is exactly double the next number and less than twice the value of the next number, assuming 2 there is no 0 between, return 0.

Example Input 1
```
1
2
4 5
```
Example Output 1
```
2
```
Explanation 1
The bracket of 2 is exactly double the next number, which is 4, and 2 is less than twice the value of the next number, which is 5.

Example Input 2
```
1
2
3 4
```
Example Output 2
```
0
```
Explanation 2
The bracket of 2 is exactly double the next number, which is 4, but 2 is not less than twice the value of the next number, which is 3.

Example Input 3
```
1
2
2 3
```
Example Output 3
```
0
```
Explanation 3
The bracket of 2 is not less than twice the next number, which is 3, therefore it is not exactly the answer.

Example Input 4
```
1
2
3 5
```
Example Output 4
```
2
```
Explanation 4
The bracket of 2 is exactly double the next number, which is 4, and 2 is less than twice the value of the next number, which is 5.

Try Example:

Input	Result
1 2 4 5	2
1 2 3 4	0
1 2 2 3	0
1 2 3 5	2

Answer: (penalty regime: 0 %)

```
def find_bracket(n, arr):
    for i in range(n-1):
        if arr[i] == 2 * arr[i+1]:
            if arr[i] < 2 * arr[i+1]:
                return arr[i]
    return 0
n = int(input())
arr = [int(input()) for _ in range(n)]
print(find_bracket(n, arr))
```

	Input	Expected	Got
✓	1 2 4 5	2	2
✓	1 2 3 4	0	0
✓	1 2 2 3	0	0
✓	1 2 3 5	2	2

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 3 Correct Mark 1.00 out of 1.00 Flag question

Given an integer `n`, return the number of trailing zeroes in `n!`.

Note that `n! = n * (n - 1) * (n - 2) * ... * 3 * 2 * 1`.

Example 1:
```
Input: n = 3
Output: 0
Explanation: 3! = 6, no trailing zero.
```
Example 2:
```
Input: n = 5
Output: 1
Explanation: 5! = 120, one trailing zero.
```
Example 3:
```
Input: n = 0
Output: 0
```
Constraints:
```
0 <= n <= 10^4
```
Try Example:

Input	Result
3	0
5	1
0	0

Answer: (penalty regime: 0 %)

```
def trailingZeroes(n):
    count = 0
    while n >= 5:
        n //= 5
        count += n
    return count
n = int(input())
print(trailingZeroes(n))
```

	Input	Expected	Got
✓	3	0	0
✓	5	1	1
✓	0	0	0

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 4 Correct Mark 1.00 out of 1.00 Flag question

Write a program in Python to display a pyramid with `*` as follows.

Try example:

Input	Result
4	* *** ***** *******

Answer: (penalty regime: 0 %)

```
n = int(input())
for i in range(1, n+1):
    print(' '*(n-i) + '*'*(2*i-1))
```

	Input	Expected	Got
✓	4	* *** ***** *******	* *** ***** *******

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 5 Correct Mark 1.00 out of 1.00 Flag question

Given an integer `num`, return the number of digits in `num` that divide `num`.

An integer `val` divides `num` if `num % val == 0`.

Example 1:
```
Input: num = 7
Output: 1
Explanation: 7 divides itself, hence the answer is 1.
```
Example 2:
```
Input: num = 121
Output: 2
Explanation: 121 divides 1, but not 2. Hence, 2 is not counted twice as a digit. So, the answer is
```
Example 3:
```
Input: num = 1248
Output: 4
Explanation: 1248 is divisible by all of its digits. Hence, the answer is 4.
```
Try Example:

Input	Result
7	1
121	2
1248	4

Answer: (penalty regime: 0 %)

```
num = int(input())
count = 0
for digit in str(num):
    if int(digit) != 0 and num % int(digit) == 0:
        count += 1
print(count)
```

	Input	Expected	Got
✓	7	1	1
✓	121	2	2
✓	1248	4	4

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 6 Correct Mark 1.00 out of 1.00 Flag question

A **happy number** is a number defined by the following process:

- Starting with any positive integer, replace the number by the sum of the squares of its digits.
- Repeat the process until the number equals 1 (where it will stay), or **loops endlessly in a cycle** which does not include 1.
- Those numbers for which this process **ends** in 1 are happy.

Return `true` if `n` is a happy number, and `false` if not.

Try example:

Input	Result
19	True
2	False

Answer: (penalty regime: 0 %)

```
def isHappy(n):
    seen = set()
    while n != 1 and n not in seen:
        seen.add(n)
        n = sum(int(digit)**2 for digit in str(n))
    return n == 1
n = int(input())
print(isHappy(n))
```

	Input	Expected	Got
✓	19	True	True
✓	2	False	False

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 7 Correct Mark 1.00 out of 1.00 Flag question

You are hiking a mountain in Nilgiris, Ooty. Unfortunately, you are lost.

Each step you can either move `up` or `down`. An `up` step means that you walk one unit to the next

Example 1:
```
Input: n = 4, steps = "DDUU"
Output: 0
Explanation: You start at sea level, go down to -2, down to -1, up to 0, up to 1.
```
Example 2:
```
Input: n = 6, steps = "DUDDUU"
Output: 1
Explanation: You start at sea level, go down to -1, up to 0, down to -1, down to -2, up to -1, up to 0.
```
Constraints:
```
2 <= n <= 10
```
Try example:

Input	Result
4 DDUU	0
6 DUDDUU	1

Answer: (penalty regime: 0 %)

```
def countValleys(n, steps):
    level = 0
    valleys = 0
    for step in steps:
        if step == 'U':
            level += 1
            if level == 0:
                valleys += 1
        else:
            level -= 1
    return valleys
n = int(input())
steps = input()
print(countValleys(n, steps))
```

	Input	Expected	Got
✓	4 DDUU	0	0
✓	6 DUDDUU	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 8 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 9 Correct Mark 1.00 out of 1.00 Flag question

Given an integer `n`, return `true` if it is a power of three. Otherwise, return `false`.

An integer `n` is a power of three, if there exists an integer `x` such that `n == 3^x`.

Example 1:
```
Input: n = 27
Output: true
Explanation: 27 = 3^3
```
Example 2:
```
Input: n = 0
Output: false
Explanation: There is no x where 3^x = 0.
```
Example 3:
```
Input: n = -1
Output: false
Explanation: There is no x where 3^x = (-1).
```
Constraints:
```
-2^31 <= n <= 2^31 - 1
```
Try example:

Input	Result
27	True
0	False
-1	False

Answer: (penalty regime: 0 %)

```
def isPowerOfThree(n):
    if n <= 0:
        return False
    while n % 3 == 0:
        n //= 3
    return n == 1
n = int(input())
print(isPowerOfThree(n))
```

	Input	Expected	Got
✓	27	True	True
✓	0	False	False
✓	-1	False	False

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 10 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 11 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```

Question 12 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 13 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 14 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 15 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 16 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 17 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 18 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 19 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 20 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 21 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 22 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 23 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 24 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 25 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 26 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 27 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 28 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 29 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 30 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the number of vowels in the string. Here, a, e, i, o, u are the vowels. Input will be a string and output should be an integer.

Example Input 1
```
Hello
```
Example Output 1
```
2
```
Example Input 2
```
Python
```
Example Output 2
```
1
```
Try Example:

Input	Result
Hello	2
Python	1

Answer: (penalty regime: 0 %)

```
s = input()
count = 0
for char in s:
    if char in 'aeiou':
        count += 1
print(count)
```

	Input	Expected	Got
✓	Hello	2	2
✓	Python	1	1

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Finish review

CD23321-Python Programming for Design-2025 Batch

Grade 100 out of 100

Started on Thursday, 24 August 2023, 7:19 AM

State Finished

Completed on Thursday, 24 August 2023, 5:39 PM

Time taken 10 hours 19 mins

Marks 10.00/10.00

Grade 100.00 out of 100.00

Question 1 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the sum of the number of prime numbers in a specified range.

The starting and ending number of the range will be provided as input to the program.

Hint: Use the function isprime() to check if a number is prime or not.

Example: If the starting and ending number is the range is given as 2 and 10, the program must return 4, because there are 4 prime numbers in the specified range (2, 3, 5, 7) and their sum is 17 (2+3+5+7).

Constraint: If the starting and ending number is the range is given as 90 and 100, the program must return 0, because there is no prime numbers in the specified range.

For example:

Input	Result
2 10	17
90 100	0

Answer: (penalty regime: 0 %)

```
def isprime(n):
    for i in range(2,n):
        if n%i==0:
            return False
    else:
        return True
start=int(input())
end=int(input())
sum=0
for num in range(start,end+1):
    if isprime(num):
        sum+=num
print(sum)
```

Input	Expected	Got
2 10	17	17
90 100	0	0

Passed all tests! ✔

Marks for this submission: 1.00/1.00.

Question 2 Correct Mark 1.00 out of 1.00 Flag question

You are choreographing a circus show with various animals. For one act, you are given two kangaroos on a number line ready to jump in the positive direction (i.e, toward positive infinity).

The first kangaroo starts at location x1 and moves at a speed of v1 meters per jump.

The second kangaroo starts at location x2 and moves at a speed of v2 meters per jump. Write a program to find whether both the kangaroos will be at the same location after the same number of jumps. If the two kangaroos cannot land at the same location after the same number of jumps, print NO. Otherwise, print YES.

Input Format

First kangaroo's starting point

v1 (speed of kangaroo 1)

Second kangaroo's starting point

v2 (speed of kangaroo 2)

Output Format

Print the program output as the same position which is printed, YES, otherwise NO.

For example:

Input	Result
0 3 4 2	YES
0 2 5 3	NO

Answer: (penalty regime: 0 %)

```
x1=int(input())
v1=int(input())
x2=int(input())
v2=int(input())
if x1>x2 and v1>v2:
    print("NO")
elif x2>x1 and v2>v1:
    print("NO")
elif (x2-x1)%(v1-v2)==0:
    print("YES")
else:
    print("NO")
```

Input	Expected	Got
0 3 4 2	YES	YES
0 2 5 3	NO	NO

Passed all tests! ✔

Marks for this submission: 1.00/1.00.

Question 3 Correct Mark 1.00 out of 1.00 Flag question

I will print a chessboard.

Write a program that takes input

Integer N(represent the size and columns of a chessboard) and also the starting character of the chessboard

Input Format:

First line chessboard size (single integer available)

Sample Input / Output:

3

#

#

#

###

###

###

Answer: (penalty regime: 0 %)

```
n=int(input())
ch=input()
for i in range(n):
    if i%2==0:
        print(ch*n)
    else:
        if ch=="#":
            print(" "*n)
        else:
            print("#"*n)
```

Input	Expected	Got
3 #	# # # ### ### ###	# # # ### ### ###
4 *	**** **** **** ****	**** **** **** ****

Passed all tests! ✔

Marks for this submission: 1.00/1.00.

Question 4 Correct Mark 1.00 out of 1.00 Flag question

An catastrophic number is a number whose square ends with the number itself.

For example, 5 is a catastrophic number because 5*5 = 25. The last digit of 25 is 5, which is the same as the given number.

Write a program to print all catastrophic numbers between 1 and N (inclusive).

Input Format:

Take a integer from keyboard

Output Format:

Print Catastrophic Digits number in Autonomatic number, otherwise few Autonomatic number found

Output:

catastrophic

Example Input:

25

Example Output:

1

5

6

25

Answer: (penalty regime: 0 %)

```
n=int(input())
for num in range(1,n+1):
    if str(num*num).endswith(str(num)):
        print("The Automorphic",num)
```

Input	Expected	Got
25	The Automorphic 1 The Automorphic 5 The Automorphic 6 The Automorphic 25	The Automorphic 1 The Automorphic 5 The Automorphic 6 The Automorphic 25
100	The Automorphic 1 The Automorphic 5 The Automorphic 6 The Automorphic 25 The Automorphic 76	The Automorphic 1 The Automorphic 5 The Automorphic 6 The Automorphic 25 The Automorphic 76

Passed all tests! ✔

Marks for this submission: 1.00/1.00.

Question 5 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the count of the maximum digit in a given number N. The number will not be present in the program as an input of type int. Hint/Hint: The input number will be a positive integer number (1 < N < 2147483647).

For example, if the given number is 1232, the program should return 2 because the maximum digit 2 is in the number.

If the given number is 45, the program should return 1because there are 1 occurrence of the maximum digit 5 in the number.

If the given number is 98, the program should return 2because there are 2 occurrences of the maximum digit 9 in the number.

If the given number is 34, the function should return 0because there are NO 4 or more repeated digits in the number.

For example:

Input	Result
1232	2
45	1
98	2
34	0

Answer: (penalty regime: 0 %)

```
n=input()
max=0
for i in n:
    if max<i:
        max=i
count=0
for i in n:
    if max==i:
        count+=1
print(count)
```

Input	Expected	Got
1232	2	2
45	1	1
98	2	2
34	0	0

Passed all tests! ✔

Marks for this submission: 1.00/1.00.

Question 6 Correct Mark 1.00 out of 1.00 Flag question

Write a program to print one of the following pattern based on input size.

Input

3

Output

```
  *
 ***
*****
```

For example:

Input	Result

3	`  *`
	` ***`
	`*****`

4	`   *`
	`  ***`
	` *****`
	`*******`

Answer: (penalty regime: 0 %)

```
n=int(input())
for i in range(1,n+1):
    print(" "*(n-i),end="")
    print("*"*(2*i-1))
```

Input	Expected	Got

3	`  *`
	` ***`
	`*****`
		`  *`
		` ***`
		`*****`

4	`   *`
	`  ***`
	` *****`
	`*******`
		`   *`
		`  ***`
		` *****`
		`*******`

Passed all tests! ✔

Marks for this submission: 1.00/1.00.

Question 7 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the sum of the squares digits in a number.

Example: Input: 12 Output: 5 (1^2 + 2^2 = 5)

Input: 22 Output: 8 (2^2 + 2^2 = 8)

Input: 9 Output: 81 (9^2 = 81)

For example:

Input	Result
12	5
22	8
9	81

Answer: (penalty regime: 0 %)

```
n=int(input())
sum=0
while n>0:
    r=n%10
    sum+=r**2
    n=n//10
print(sum)
```

Input	Expected	Got
12	5	5
22	8	8
9	81	81

Passed all tests! ✔

Marks for this submission: 1.00/1.00.

Question 8 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the sum of the squares digits in a number.

Example: Input: 12 Output: 5 (1^2 + 2^2 = 5)

Input: 22 Output: 8 (2^2 + 2^2 = 8)

Input: 9 Output: 81 (9^2 = 81)

For example:

Input	Result
12	5
22	8
9	81

Answer: (penalty regime: 0 %)

```
n=int(input())
sum=0
while n>0:
    r=n%10
    sum+=r**2
    n=n//10
print(sum)
```

Input	Expected	Got
12	5	5
22	8	8
9	81	81

Passed all tests! ✔

Marks for this submission: 1.00/1.00.

Question 9 Correct Mark 1.00 out of 1.00 Flag question

Write a program to find the sum of the squares digits in a number.

Example: Input: 12 Output: 5 (1^2 + 2^2 = 5)

Input: 22 Output: 8 (2^2 + 2^2 = 8)

Input: 9 Output: 81 (9^2 = 81)

For example:

Input	Result
12	5
22	8
9	81

Answer: (penalty regime: 0 %)

```
n=int(input())
sum=0
while n>0:
    r=n%10
    sum+=r**2
    n=n//10
print(sum)
```

Input	Expected	Got
12	5	5
22	8	8
9	81	81

Passed all tests! ✔

Marks for this submission: 1.00/1.00.

Question 10 Correct Mark 1.00 out of 1.00 Flag question

Write a program that prints an integer 'n' and the number of integers that are less than or equal to 'n' and co-prime to 'n'

Two integers a and b are said to be relatively prime or co-prime if the only positive integer that evenly divides both of them is 1. That is, the only common positive factor of the two numbers is 1. This is equivalent to their greatest common divisor being 1.

Input Formate

One line containing the number of 'n', where 1<=n<=10,00

Output Formate

One line containing the number of integers that are co-prime to n and less than or equal to n

Sample Test Cases

Test Case 1

Input

10

Output

4

Test Case 2

Input

12

Output

4

Test Case 3

Question 1 Correct Mark 1.00 out of 1.00 Flag question

Given an integer number and you have to count the digits using recursion using Python program. In this program, you will be reading an integer number and counting the total digits, using a function countDigits() which will take a number as an argument and return the count after recursion process.
Input Format: The first and only line of the input contains a single integer n
Output Format: Output a single line denoting the number of digits in n.

For example:

Test	Result
print(countDigits(3001))	3

Answer: (penalty regime: 0 %)

Reset answer

```
def countDigits(n):
    if n<10:
        return 1
    return 1 + countDigits(n//10)
```

	Test	Expected	Got	
✓	print(countDigits(12345))	5	5	✓
✓	print(countDigits(300))	3	3	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 2 Correct Mark 1.00 out of 1.00 Flag question

Complete the recursive function to return Binary Equivalent of an Integer using Recursion.

Sample Test Cases
Test Case 1
Input
10
Output
1010
Test Case 2
Input
257
Output
100000001

For example:

Test	Result
print(binaryNumber(10))	1010
print(binaryNumber(257))	100000001

Answer: (penalty regime: 0 %)

Reset answer

```
def binaryNumber(n):
    if n==1:
        return str(n)
    return binaryNumber(n//2)+str(n%2)

```

	Test	Expected	Got	
✓	print(binaryNumber(10))	1010	1010	✓
✓	print(binaryNumber(257))	100000001	100000001	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 3 Correct Mark 1.00 out of 1.00 Flag question

Euclid was a Greek mathematician who lived approximately 2,300 years ago. His
algorithm for computing the greatest common divisor of two positive integers, a and
b, is both efficient and recursive. It is outlined below:

If b is 0 then
  return a
Else
  Set c equal to the remainder when a is divided by b
  Return the greatest common divisor of b and c

Write a Recursive function that implements Euclid's algorithm and uses it to determine the
greatest common divisor of two integers entered by the user. Test your program with some very large integers. The result will be computed quickly, even for huge numbers consisting of hundreds of digits, because Euclid's algorithm is extremely efficient.

For example:

Test	Result
print(gcd(8, 12))	4
print(gcd(720, 1000))	40

Answer: (penalty regime: 0 %)

Reset answer

```
def gcd(a,b):
    if b==0:
        return a
    return gcd(b,a%b)
```

	Test	Expected	Got	
✓	print(gcd(8, 12))	4	4	✓
✓	print(gcd(720, 1000))	40	40	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 4 Correct Mark 1.00 out of 1.00 Flag question

Complete a Recursive Function to find if a given number N can be expressed as a sum of two prime numbers.

Note: YOU MUST OPTIMIZE the logic to find whether a number is prime or not, as very large prime numbers are provided as input. If the logic is not optimized your program will NOT get executed within the given time limit.

Input Format:

First line contains number N.

Output Format:

Return either yes or no.

Boundary Conditions / Constraints:

3 <= N <= 10^9

Example Input/Output 1:

Input:

20

Output:

yes

Input:

23

Ouput:

no

Explanation:

20 can be expressed as 17+3

23 cannot be expressed as sum of two primes

For example:

Test	Result
print(checkPrimeSum(20))	yes
print(checkPrimeSum(23))	no

Answer: (penalty regime: 0 %)

Reset answer

```
def is_prime(num,i=2):
    if i*i>num:
        return False
    if i*i==num:
        return True
    if num%i==0:
        return False
    return is_prime(num,i+1)
def find_pair(n,a=2):
    if a>n-a:
        return False
    if is_prime(a) and is_prime(n-a):
        return True
    return find_pair(n,a+1)

def checkPrimeSum(n):
    if find_pair(n):
        return "yes"
    else:
        return "no"

```

	Test	Expected	Got	
✓	print(checkPrimeSum(20))	yes	yes	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 5 Correct Mark 1.00 out of 1.00 Flag question

The notion of a palindrome was introduced previously. In this exercise you will write a recursive function that determines whether or not a string is a palindrome. The empty string is a palindrome, as is any string containing only one character. Any longer string is a palindrome if its first and last characters match, and if the string formed by removing the first and last characters is also a palindrome.

Write a program that reads a string from the user and uses your recursive
function to determine whether or not it is a palindrome. Then your program should
display an appropriate message for the user.

Sample Input
malayalam
Sample Output
That was a palindrome!
Sample Input
madam
Sample Output
That is not a palindrome.

Answer: (penalty regime: 0 %)

Reset answer

```
def isPalindrome(s):
    if len(s) <= 1:
        return True
    return s[0]==s[-1] and isPalindrome(s[1:-1])

line = input()
if isPalindrome(line):
    print("That was a palindrome!")
else:
    print("That is not a palindrome.")

```

	Input	Expected	Got	
✓	malayalam	That was a palindrome!	That was a palindrome!	✓
✓	madam	That is not a palindrome.	That is not a palindrome.	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 1

Correct Mark 1.00 out of 1.00 Flag question

complete function to implement coin change making problem i.e. finding the minimum
number of coins of certain denominations that add up to given amount of money.
The only available coins are of values 1, 2, 3, 4
Input Format:
Integer input from stdin.
Output Format:
return the minimum number of coins required to meet the given target.
Example Input:
16
Output:
4
Explanation:
We need only 4 coins of value 4 each.
Example Input:
25
Output:
7
Explanation:
We need 6 coins of 4 value, and 1 coin of 1 value

Answer: (penalty regime: 0 %)

Reset answer

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.

Question 2

Correct Mark 1.00 out of 1.00 Flag question

A number is considered to be ugly if its only prime factors are 2, 3 or 5.
[1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, ...] is the sequence of ugly numbers.
Task:
complete the function which takes a number n as input and checks if it's an ugly number.
return ugly if it is ugly, else return not ugly
Hint:
An ugly number U can be expressed as: U = 2^a * 3^b * 5^c, where a, b and c are nonnegative integers.

For example:

Test	Result
print(checkUgly(6))	ugly
print(checkUgly(21))	not ugly

Answer: (penalty regime: 0 %)

Reset answer

Ace editor not ready. Perhaps reload page?
Falling back to raw text area.

```
def checkUgly(n):
    while(n%2==0):
        n=n//2
    while(n%3==0):
        n=n//3
    while(n%5==0):
        n=n//5
    if(n==1):
        return "ugly"
    else:
        return "not ugly"
```

	Test	Expected	Got

✔	print(checkUgly(21))	not ugly	not ugly	✔

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.

Question 3

Correct Mark 1.00 out of 1.00 Flag question

An e-commerce company plans to give their customers a special discount for Christmas.
They are planning to offer a flat discount. The discount value is calculated as the sum of all
the prime digits in the total bill amount.
Write an algorithm to find the discount value for the given total bill amount.
Constraints
1 <= orderValue< 10e100000
Input
The input consists of an integer orderValue, representing the total bill amount.
Output
Print an integer representing the discount value for the given total bill amount,
Example Input
578
Output
12

For example:

Test	Result
print(christmasDiscount(578))	12

Answer: (penalty regime: 0 %)

Reset answer

Ace editor not ready. Perhaps reload page?
Falling back to raw text area.

```
def christmasDiscount(n):
    num=0
    while (n>0):
        a=n%10
        if(a==2 or a==3 or a==5 or a==7):
            num=num+a
        n=n//10
    return num
```

	Test	Expected	Got	
✔	print(christmasDiscount(578))	12	12	✔

✔	print(christmasDiscount(222))	6	6	✔
✔	print(christmasDiscount(77777))	35	35	✔

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.

Question 4

Correct Mark 1.00 out of 1.00 Flag question

A strobogrammatic number is a number that looks the same when rotated 180 degrees (looked at upside down).
Write a program to determine if a number is strobogrammatic. The number is represented as a string.

Example 1:

Input:

69

Output:

true

Example 2:

Input:

88

Output:

true

Example 3:

Input:

962

Output:

false

Example 4:

Input:

1

Output:

true

For example:

Test	Result
print(StroboGrammatic(69))	True
print(StroboGrammatic(962))	False

Answer: (penalty regime: 0 %)

Reset answer

Question 1 Correct Mark 2.00 out of 2.00 Flag question

Counting Even Numbers in a Range

Counting is a universal pattern every kitten of the English alphabet appears at least once.

Write a program that counts how many numbers in a given range are even.

Constraints

Input

Input contains two integers separated by a space, start and end.

Output

Output a single integer — the count of even numbers in the range [start, end] (inclusive).

Sample 1

Input

2 10

Output

5

Explanation: numbers counted are 2, 4, 6, 8, 10

Sample 2

Input

1 1

Output

0

Explanation: 1 is not even

Constraints

1 ≤ start, end ≤ 10^9

Time limit: 1 second

Memory limit: 256 MB

Hint

Think about the formula: count = (end // 2) - ((start - 1) // 2)

For the record: Any solution that uses a loop to check each number will be too slow for large ranges. Aim for a solution that runs in constant time.

Input format

Two integers start and end, separated by a space, on a single line.

Output format

Print a single integer — the count of even numbers in the range [start, end] (inclusive).

For the record: Any solution that uses a loop to check each number will be too slow for large ranges. Aim for a solution that runs in constant time.

Sample Input/Output

Input	Result
2 10	5
1 1	0

Answer: (penalty regime: 0 %)

```
start, end = map(int, input().split())
print((end // 2) - ((start - 1) // 2))
```

Test Expected Got

Test	Expected	Got
1	5	5
2	0	0

Passed all tests! ✓

Marks for this submission: 2.00/2.00.

Question 2 Correct Mark 2.00 out of 2.00 Flag question

Count the hidden words in my words and check the given input is my word or not.

Input:first line contains a string, second line contains the word to be searched.

Output:

Print "Found" if the word is present in the string, otherwise print "Not Found".

Sample Input:

hello world

world

Sample Output:

Found

For the record: Any solution that uses a loop to check each number will be too slow for large ranges. Aim for a solution that runs in constant time.

Question 1 Correct Mark 1.00 out of 1.00 Flag question

There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.
Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

Example 1:

Input: text = "hello world", brokenLetters = "ad"

Output:

1

Explanation: We cannot type "world" because the 'd' key is broken.

For example:

Input	Result
hello world ad	1
Faculty Upskilling in Python Programming pb	2

Answer: (penalty regime: 0 %)

```
text = input()
broken = input()

words = text.split()
count=0
broken_set = set(broken.lower())

for word in words:
    possible=True

    for letter in word:
        if letter.lower() in broken_set:
            possible = False
            break
    if possible:
        count+=1

print(count)
```

	Input	Expected	Got	
✓	hello world ad	1	1	✓
✓	Welcome to NEC z	3	3	✓
✓	Faculty Upskilling in Python Programming pb	2	2	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 2 Correct Mark 1.00 out of 1.00 Flag question

The program must accept a string S which represents a series of keystrokes as the input. There are two special keystrokes denoted by "-" for undo operation and "+" for redo operation. The undo operation removes the last typed character and redo operations reverses the immediately done last undo operations.
The program must accept the keystrokes and perform all the operations (undo and redo). Finally, the program must print the string after applying all the operations as the output.

Boundary Condition(s):

1 <= Length of string <= 1000

Input Format:

The first line contains the string S.

Output Format:

The first line contains the modified string.

Example Input/Output 1:

Input:

missall^s^r^y^ak^s^y^p

Output:

missyp

Explanation:

The characters **missall** are followed by three undo operations which deletes last three characters.

So the string **missall** becomes **mis.**

The three undo operations are followed by one redo operation which reverses the last undo operation.

So the string **mis** becomes **miss.**

Then the characters yak are entered which are followed by two undo operations so the last two characters are removed.

So the string becomes **missyp.**

Then a redo operation is applied which reverses the last undo operation and so the string **missyp** becomes **missyak.**

The characters are followed by **s** so the final string is missyak.

Answer: (penalty regime: 0 %)

```
s = input()
text=[]
redo=[]

i=0

while i<len(s):
    if s[i]=='-':
        i+=1
        text.append(text.pop())
    elif s[i]=='+':
        i+=1
        text.append(redo.pop())
    else:
        text.append(s[i])
        redo=[]
        i+=1

print(''.join(text))
```

	Input	Expected	Got	
✓	missall^s^r^y^ak^s^y^p	missyak	missyak	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 3 Correct Mark 1.00 out of 1.00 Flag question

A sentence is a list of words that are separated by a single space with no leading or trailing spaces. Each word consists of lowercase and uppercase English letters.

A sentence can be shuffled by appending the 1-indexed word position to each word then rearranging the words in the sentence.

For example, the sentence "This is a sentence" can be shuffled as "sentence4 a2 This1 is3" or "is2 sentence4 This1 a3".

Given a shuffled sentence s containing no more than 9 words, reconstruct and return the original sentence.

Example 1:

Input:

is2 sentence4 This1 a3

Output:

This is a sentence

Explanation: Sort the words in s to their original positions "This1 is2 a3 sentence4", then remove the numbers.

Example 2:

Input:

Myself2 Me1 I4 and3

Output:

Me Myself and I

Explanation: Sort the words in s to their original positions "Me1 Myself2 and3 I4", then remove the numbers.

Constraints:

2 <= s.length <= 200

s consists of lowercase and uppercase English letters, spaces, and digits from 1 to 9.

The number of words in s is between 1 and 9.

The words in s are separated by a single space.

s contains no leading or trailing spaces.

Answer: (penalty regime: 0 %)

```
s = input()
words=s.split()
answer=[]

for i in range(1,10):
    for word in words:
        if word[-1]==str(i):
            answer.append(word[:-1])
print(' '.join(answer))
```

	Input	Expected	Got	
✓	is2 sentence4 This1 a3	This is a sentence	This is a sentence	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 4 Correct Mark 1.00 out of 1.00 Flag question

Given an array of strings words, *return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.*

In the **American keyboard**:

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

Example 1:

Input: words = ["Hello","Alaska","Dad","Peace"]

Output: ["Alaska","Dad"]

Example 2:

Input: words = ["omk"]

Output: []

Example 3:

Input: words = ["adsdf","sfd"]

Output: ["adsdf","sfd"]

For example:

Input	Result
4 Hello Alaska Dad Peace	Alaska Dad
2 adsfd sdfd	adsfd sdfd

Answer: (penalty regime: 0 %)

```
row1 = "qwertyuiop"
row2 = "asdfghjkl"
row3 = "zxcvbnm"

answer = []

for i in range(n):
    word=words[i]
    lower=word.lower()
    if all(c in row1 for c in w):
        answer.append(word)
    elif all(c in row2 for c in w):
        answer.append(word)
    elif all(c in row3 for c in w):
        answer.append(word)

for letter[answer] in A:
print("No words")
else:
    print(answer)
```

	Input	Expected	Got	
✓	4 Hello Alaska Dad Peace	Alaska Dad	Alaska Dad	✓
✓	1 omk	No words	No words	✓
✓	2 adsfd sdfd	adsfd sdfd	adsfd sdfd	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 5 Correct Mark 1.00 out of 1.00 Flag question

Given a number, convert it into corresponding alphabet.

Input	Output
1	A
26	Z
27	AA
676	YZ

Input Format

Input is an integer

Output Format

Print the alphabets

Constraints

1 <= num <= 4294967295

Sample Input 1

26

Sample Output 1

Z

For example:

Test	Result
print(excelNumber(26))	Z

Answer: (penalty regime: 0 %)

Reset answer

CD23321-Python Programming for Design-2025 Batch

Question 1 Solved Mandatory

You are given an integer type `n`, containing binary numbers. Your task is to perform a sequence of operations on the type and print its binary string. The operations are defined as follows:

1. Left Shift: Shift the binary string to the left by one position, appending a '0' to the end.
2. Complete: Print the final binary string and terminate the program.

The initial value of type `n` is given as the binary string for number 23 (10111).

Constraints

- The initial value of `n` is a valid binary integer.
- The operation list will contain at least one and at most 100 valid operations.
- The program must terminate after the `Complete` operation is executed.

Example

Input: 10111 0 0 0 1

Output:

10111000

Explanation: `n` is `10111`. The first operation is `0`, so the binary shifts left. `n` is `10111000`.

Operation `0`: `n` is `10111000` and the binary shifts left. `n` is `101110000`.

Operation `0`: `n` is `101110000` and the binary shifts left. `n` is `1011100000`.

Operation `1`: `n` is `1011100000` and the binary is printed. `n` is `1011100000`.

Operation `2`: `n` is `1011100000` and the program terminates. `n` is `1011100000`.

Time Limit: 1 sec

Memory Limit: 256 MB

For example:

Input	Result
10111 0 0 0 1	10111000

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	10111000	10111000
2	1011100000	1011100000
3	1011100000	1011100000

Passed all tests! ✓

Question 2 Solved Mandatory

There is a multiprocessing Application where a timer keeps ticks for each server. All server ticks are the duplicate each program.

Write a program to find the number of ticks that are unique to each server. Given two lists of integers, where each list represents the ticks recorded by a different server, find and return the number of ticks that appear only in one of the two lists.

Input Format

Two lines: "ticks count, ticks values list - 1, ticks values list - 2"

Output Format

Print the number of unique ticks.

Sample Input

```
5 1 2 3 4 5
3 2 4 6
```

Sample Output

```
3
```

Explanation: The unique ticks are 1, 3, and 5.

For example:

Input	Result
5 1 2 3 4 5 3 2 4 6	3
3 10 20 30 3 40 50 60	6

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	3	3
2	6	6

Passed all tests! ✓

Question 3 Solved Mandatory

Create a class to compute the area of a square. Override the area method in the child class to calculate the area of a square.

Example:

Input: 10 // 10 is the side of a square

Output: 100

Input: 20 // 20 is the side of a square

Output: 400

For example:

Input	Result
10	100
20	400

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	100	100
2	400	400

Passed all tests! ✓

Question 4 Solved Mandatory

Write a program to print all the prime factors in an array. Factors are the numbers that you can multiply to get a number. For example, the prime factors of 24 are 2, 2, 2, and 3 because 2 × 2 × 2 × 3 = 24. Here, 2 and 3 are prime numbers.

Input Format:

The first line contains an integer `input from user` which is any integer.

Output Format:

Print the Desired Output as it is any. If register the print it if space Separated

Example Input:

```
24
```

Example Output:

```
2 2 2 3
```

For example:

Input	Result
24	2 2 2 3
7	7
100	2 2 5 5

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	2 2 2 3	2 2 2 3
2	7	7
3	2 2 5 5	2 2 5 5

Passed all tests! ✓

Question 5 Solved Mandatory

Write a program to eliminate the common elements in the given 2 array and print only the non-repeating

elements in the sorted order of the array after removing the elements.

Input Format:

The first line contains space-separated integers (space), denoting the size of the first list and the integer follow respectively.

The second line contains space-separated integers denoting the elements of the second list.

Example Input:

```
5
1 2 3 4 5
4
3 4 5 6
```

Example Output:

```
1 2 6
```

For example:

Input	Result
5 1 2 3 4 5 4 3 4 5 6	1 2 6
3 1 2 3 3 4 5 6	1 2 3 4 5 6

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	1 2 6	1 2 6
2	1 2 3 4 5 6	1 2 3 4 5 6

Passed all tests! ✓

Question 6 Solved Mandatory

Write a program to eliminate the common elements in the given 2 array and print only the non-repeating

elements in the sorted order of the array after removing the elements.

Input Format:

The first line contains space-separated integers (space), denoting the size of the first list and the integer follow respectively.

The second line contains space-separated integers denoting the elements of the second list.

Example Input:

```
5
1 2 3 4 5
4
3 4 5 6
```

Example Output:

```
1 2 6
```

For example:

Input	Result
5 1 2 3 4 5 4 3 4 5 6	1 2 6
3 1 2 3 3 4 5 6	1 2 3 4 5 6

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	1 2 6	1 2 6
2	1 2 3 4 5 6	1 2 3 4 5 6

Passed all tests! ✓

Question 7 Solved Mandatory

Write a program to eliminate the common elements in the given 2 array and print only the non-repeating

elements in the sorted order of the array after removing the elements.

Input Format:

The first line contains space-separated integers (space), denoting the size of the first list and the integer follow respectively.

The second line contains space-separated integers denoting the elements of the second list.

Example Input:

```
5
1 2 3 4 5
4
3 4 5 6
```

Example Output:

```
1 2 6
```

For example:

Input	Result
5 1 2 3 4 5 4 3 4 5 6	1 2 6
3 1 2 3 3 4 5 6	1 2 3 4 5 6

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	1 2 6	1 2 6
2	1 2 3 4 5 6	1 2 3 4 5 6

Passed all tests! ✓

Question 8 Solved Mandatory

Write a program to eliminate the common elements in the given 2 array and print only the non-repeating

elements in the sorted order of the array after removing the elements.

Input Format:

The first line contains space-separated integers (space), denoting the size of the first list and the integer follow respectively.

The second line contains space-separated integers denoting the elements of the second list.

Example Input:

```
5
1 2 3 4 5
4
3 4 5 6
```

Example Output:

```
1 2 6
```

For example:

Input	Result
5 1 2 3 4 5 4 3 4 5 6	1 2 6
3 1 2 3 3 4 5 6	1 2 3 4 5 6

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	1 2 6	1 2 6
2	1 2 3 4 5 6	1 2 3 4 5 6

Passed all tests! ✓

Question 9 Solved Mandatory

Write a program to eliminate the common elements in the given 2 array and print only the non-repeating

elements in the sorted order of the array after removing the elements.

Input Format:

The first line contains space-separated integers (space), denoting the size of the first list and the integer follow respectively.

The second line contains space-separated integers denoting the elements of the second list.

Example Input:

```
5
1 2 3 4 5
4
3 4 5 6
```

Example Output:

```
1 2 6
```

For example:

Input	Result
5 1 2 3 4 5 4 3 4 5 6	1 2 6
3 1 2 3 3 4 5 6	1 2 3 4 5 6

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	1 2 6	1 2 6
2	1 2 3 4 5 6	1 2 3 4 5 6

Passed all tests! ✓

Question 10 Solved Mandatory

Write a program to eliminate the common elements in the given 2 array and print only the non-repeating

elements in the sorted order of the array after removing the elements.

Input Format:

The first line contains space-separated integers (space), denoting the size of the first list and the integer follow respectively.

The second line contains space-separated integers denoting the elements of the second list.

Example Input:

```
5
1 2 3 4 5
4
3 4 5 6
```

Example Output:

```
1 2 6
```

For example:

Input	Result
5 1 2 3 4 5 4 3 4 5 6	1 2 6
3 1 2 3 3 4 5 6	1 2 3 4 5 6

Answer: (penalty regime: 0 %)

```
Reset answer
```

Test | Expected | Got

Test	Expected	Got
1	1 2 6	1 2 6
2	1 2 3 4 5 6	1 2 3 4 5 6

Passed all tests! ✓

Question 11 Solved Mandatory

Write a program to eliminate the common elements in the given 2 array and print only the non-repeating

elements in the sorted order of the array after removing the elements.

Input Format:

The first line contains space-separated integers (space), denoting the size of the first list and the integer follow respectively.

The second line contains space-separated integers denoting the elements of the second list.

Example Input:

```
5
1 2 3 4 5
4
3 4 5 6
```

Example Output:

```
1 2 6
```

For example:

Input	Result
5 1 2 3 4 5 4 3 4 5 6	1 2 6
3 1 2 3 3 4 5 6	1 2 3 4 5 6

Answer: (penalty regime: 0 %)

```
Reset answer
```

Question 27 Solved Mandatory

Write a program to eliminate the common elements in the given 2 array and print only the non-repeating

elements in the sorted order of the array after removing the elements.

Input Format:

The first line contains space-separated integers (space), denoting the size of the first list and the integer follow respectively.

The second line contains space-separated integers denoting the elements of the second list.

Example Input:

```
5
1 2 3 4 5
4
3 4 5 6
```

Example Output:

```
1 2 6
```

For example:

Input	Result
5 1 2 3 4 5 4 3 4 5 6	1 2 6
3 1 2 3 3 4 5 6	1 2 3 4 5 6

Answer: (penalty regime: 0 %)

```

Question 28 Solved Mandatory

Write a program to eliminate the common elements in the given 2 array and print only the non-repeating

elements in the sorted order of the array after removing the elements.

Input Format:

The first line contains space-separated integers (space), denoting the size of the first list and the integer follow respectively.

The second line contains space-separated integers denoting the elements of the second list.

Example Input:

```
5
1 2 3 4 5
4
3 4 5 6
```

Example Output:

```
1 2 6
```

For example:

Input	Result
5 1 2 3 4 5 4 3 4 5 6	1 2 6
3 1 2 3 3 4 5 6	1 2 3 4 5 6

Answer: (penalty regime: 0 %)

```

Status Finished
Completed Monday, 3 November 2025, 10:19 PM
Time taken 2 hours 19 min
Marks 10.00/10.00
Grade 10.00 out of 10.00 (100%)

Question 1 Correct Mark 10.00 out of 10.00 Flag question

Here are a few series of numbers (1 or more). Is a definite rule in the series represents a rule can be identified. Find the rule in all exhibited. Implement the rule in a function and return the next number in the series.

Examples:

Input: 1 (number of terms in series)
output: 1 (next number)
Input: 2 (number of terms in series)
output: 2 (next number)
Input: 3 (number of terms in series)
output: 3 (next number)

Sample Input

1

Sample Output

1

Answer: (penalty regime: 0 %)

```
# Write your code here
def next_number(n):
    return n  # Replace with your logic

# Example usage
print(next_number(1))
```

Input	Expected	Got

Correct

Question 2 Correct Mark 10.00 out of 10.00 Flag question

Implement a function to check whether a number is a multiple of 11 or not. Without using any operators. Only bitwise operators are allowed.

Hint: Use the alternating sum of digits concept.

Example: 121 is a multiple of 11 because 1 - 2 + 1 = 0, which is a multiple of 11.

Input: 121
Output: 1

Input: 123
Output: 0

Sample Input

121

Sample Output

1

Answer: (penalty regime: 0 %)

```
def is_multiple_of_11(n):
    # Handle negative numbers
    n = abs(n)
    # Alternating sum of digits
    alt_sum = 0
    sign = 1
    while n > 0:
        alt_sum += sign * (n & 1)  # Add or subtract the last bit
        sign = -sign  # Alternate the sign
        n >>= 1  # Move to the next bit
    # Check if the alternating sum is a multiple of 11
    return 1 if alt_sum % 11 == 0 else 0

# Example usage
print(is_multiple_of_11(121))  # Output: 1
print(is_multiple_of_11(123))  # Output: 0
```

Correct

Question 4 Correct Mark 10.00 out of 10.00 Flag question

Here is another variant of the coin counting problem.

Given:
- A list of coin denominations (e.g., [1, 5, 10, 25])
- A target amount (e.g., 30)

Find:
- The minimum number of coins needed to make the target amount.
- If it's impossible to make the target amount with the given coins, return -1.

Input Format:

Line 1: Space-separated integers representing the coin denominations
Line 2: An integer representing the target amount

Output Format:

The minimum number of coins needed to make the target amount, or -1 if it's impossible.

Sample Input 1:

```
1 5 10 25
30
```

Sample Output 1:

```
2
```

Explanation:

You can make 30 cents with a minimum of 2 coins: one 25-cent coin and one 5-cent coin.

Sample Input 2:

```
2 4
7
```

Sample Output 2:

```
-1
```

Explanation:

It's impossible to make 7 cents with only 2-cent and 4-cent coins.

Answer: (penalty regime: 0 %)

```
# Read input
coins = list(map(int, input().split()))
target = int(input())

# Initialize DP array
dp = [float('inf')] * (target + 1)
dp[0] = 0

# Fill DP array
for coin in coins:
    for i in range(coin, target + 1):
        dp[i] = min(dp[i], dp[i - coin] + 1)

# Output result
print(dp[target] if dp[target] != float('inf') else -1)
```

Input	Expected	Got

Correct

Question 5 Correct Mark 10.00 out of 10.00 Flag question

Implement a function to check whether a number is a multiple of 11 or not. Without using any operators. Only bitwise operators are allowed.

Hint: Use the alternating sum of digits concept.

Example: 121 is a multiple of 11 because 1 - 2 + 1 = 0, which is a multiple of 11.

Input: 121
Output: 1

Input: 123
Output: 0

Sample Input 1

121

Sample Output 1

1

Sample Input 2

123

Sample Output 2

0

Answer: (penalty regime: 0 %)

```
def is_multiple_of_11(n):
    # Handle negative numbers
    n = abs(n)
    # Alternating sum of digits
    alt_sum = 0
    sign = 1
    while n > 0:
        alt_sum += sign * (n & 1)  # Add or subtract the last bit
        sign = -sign  # Alternate the sign
        n >>= 1  # Move to the next bit
    # Check if the alternating sum is a multiple of 11
    return 1 if alt_sum % 11 == 0 else 0

# Example usage
print(is_multiple_of_11(121))  # Output: 1
print(is_multiple_of_11(123))  # Output: 0
```

Input	Expected	Got
121	1	1
123	0	0

Completed on Wednesday, 19 October 2022, 11:03 PM

Time taken 3 mins 46 secs

Marks 10.00/10.00

Grade 100.00 out of 100.00

Question 1 Correct Mark 10.00 out of 10.00 Flag question

Develop a Python program to copy the contents of a text file to another file.

Description

- **Input**
  - Input file and destination file names.
- **Output**
  - The contents of the source file copied to the destination file.

For example:

Test	Input	Result
with open('source.txt', 'r') as file1: data = file1.read() print(data)	source.txt Hello, world! This is a test file. destination.txt	Hello, world! This is a test file.

Answer: (penalty regime: 0 %)

```
source_file = input()
destination_file = input()
with open(source_file, 'r') as file1:
    data = file1.read()
with open(destination_file, 'w') as file2:
    file2.write(data)
```

Test	Input	Expected	Got
with open('source.txt', 'r') as file1: data = file1.read() print(data)	source.txt Hello, world! This is a test file. destination.txt	Hello, world! This is a test file.	Hello, world! This is a test file.
with open('source.txt', 'r') as file1: data = file1.read() print(data)	source.txt Python is a powerful language. It is easy to learn. destination.txt	Python is a powerful language. It is easy to learn.	Python is a powerful language. It is easy to learn.
with open('source.txt', 'r') as file1: data = file1.read() print(data)	source.txt Sample Data destination.txt	Sample Data	Sample Data

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 2 Correct Mark 5.00 out of 5.00 Flag question

Create a Python program to read a specific line from a text file based on a given line number.

Description

- **Input**
  - A text file with multiple lines.
  - A line number to retrieve.
- **Output**
  - The content of the text file specified by the line number.

Example

Input:

example.txt

Line One

Line Two

Line Three

Line Four

Line Five

3

Output:

Line Three

For example:

Input	Result
example.txt 3	Line Three

Answer: (penalty regime: 0 %)

```
file_name = input()
line_number = int(input())
with open(file_name, 'r') as file:
    lines = file.readlines()
    if 1 <= line_number <= len(lines):
        print(lines[line_number - 1].strip())
    else:
        print("Line number out of range.")
```

Input	Expected	Got
example.txt 3	Line Three	Line Three
example.txt 1	Line One	Line One
example.txt 5	Line Five	Line Five

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 3 Correct Mark 5.00 out of 5.00 Flag question

Develop a Python program to read a specific line from a text file based on a given line number.

Description

- **Input**
  - A text file with multiple lines.
  - A line number to retrieve.
- **Output**
  - The content of the text file specified by the line number.

Input File:

example.txt

Line One

Line Two

Line Three

Line Four

Line Five

For example:

Input	Result
example.txt 3	Line Three

Answer: (penalty regime: 0 %)

```
file_name = input()
line_number = int(input())
with open(file_name, 'r') as file:
    lines = file.readlines()
    if 1 <= line_number <= len(lines):
        print(lines[line_number - 1].strip())
    else:
        print("Line number out of range.")
```

Input	Expected	Got
example.txt 3	Line Three	Line Three
example.txt 1	Line One	Line One
example.txt 5	Line Five	Line Five

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 4 Correct Mark 10.00 out of 10.00 Flag question

Create a Python program to read a text file and count the total number of words in the file.

Description

- **Input**
  - A text file with multiple lines.
- **Output**
  - The content of the text file specified by the name entered in the "scanner.txt"

Format

- **Input File Contents**

  Total Lines

  Line Data

  Line Data

  Line Data

- **Output**

  Total Words

Example

Input File:

scanner.txt

Line One

Line Two

Line Three

Output:

Total Words: 6

For example:

Test	Input	Result
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Hello, world! This is a test file.	Hello, world! This is a test file.

Answer: (penalty regime: 0 %)

```
with open('scanner.txt', 'r') as file:
    data = file.read()
    print(data)
with open('scanner.txt', 'r') as file:
    words = file.read().split()
    word_count = len(words)
print("Total Words:", word_count)
```

Test	Input	Expected	Got
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Hello, world! This is a test file.	Hello, world! This is a test file.	Hello, world! This is a test file.
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Python is a powerful language. It is easy to learn.	Python is a powerful language. It is easy to learn.	Python is a powerful language. It is easy to learn.

Question 6 Correct Mark 10.00 out of 10.00 Flag question

Write a Python program to reverse the contents of a specific line in a text file based on a given line number.

Description

- **Input**
  - A text file with multiple lines.
  - A line number to reverse.
- **Output**
  - The content of the text file specified by the name entered in the "scanner.txt"

Format

- **Input File Contents**

  Total Lines

  Line Data

  Line Data

  Line Data

- **Output**

  Total Words

Example

Input File:

scanner.txt

Line One

Line Two

Line Three

Output:

Total Words: 6

For example:

Test	Input	Result
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Hello, world! This is a test file.	Hello, world! This is a test file.

Answer: (penalty regime: 0 %)

```
with open('scanner.txt', 'r') as file:
    data = file.read()
    print(data)
with open('scanner.txt', 'r') as file:
    words = file.read().split()
    word_count = len(words)
print("Total Words:", word_count)
```

Test	Input	Expected	Got
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Hello, world! This is a test file.	Hello, world! This is a test file.	Hello, world! This is a test file.
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Python is a powerful language. It is easy to learn.	Python is a powerful language. It is easy to learn.	Python is a powerful language. It is easy to learn.
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Sample Data	Sample Data	Sample Data

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 7 Correct Mark 10.00 out of 10.00 Flag question

Write a Python program to count the frequency of each word in a given text file.

Description

- **Input**
  - A text file with multiple lines.
  - A word to search for.
- **Output**
  - The number of occurrences of the word in "scanner.txt"

Format

- **Input File Contents**

  Total Lines

  Line Data

  Line Data

  Line Data

- **Output**

  Total Words

Example

Input File:

scanner.txt

Line One

Line Two

Line Three

Output:

Total Words: 6

For example:

Test	Input	Result
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Hello, world! This is a test file.	Hello, world! This is a test file.

Answer: (penalty regime: 0 %)

```
with open('scanner.txt', 'r') as file:
    data = file.read()
    print(data)
with open('scanner.txt', 'r') as file:
    words = file.read().split()
    word_count = len(words)
print("Total Words:", word_count)
```

Test	Input	Expected	Got
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Hello, world! This is a test file.	Hello, world! This is a test file.	Hello, world! This is a test file.
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Python is a powerful language. It is easy to learn.	Python is a powerful language. It is easy to learn.	Python is a powerful language. It is easy to learn.
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Sample Data	Sample Data	Sample Data

Marks for this submission: 5.00/5.00.

Question 8 Correct Mark 10.00 out of 10.00 Flag question

Develop a Python program to count the frequency of each word in a given text file.

Description

- **Input**
  - A text file with multiple lines.
- **Output**
  - A dictionary of words and their frequencies.

For example:

Test	Result
import collections print("collections imported successfully")	collections imported successfully

Answer: (penalty regime: 0 %)

```
import collections
print("collections imported successfully")
```

Test	Input	Expected	Got
import collections print("collections imported successfully")		collections imported successfully	collections imported successfully
import collections print("collections imported successfully")		collections imported successfully	collections imported successfully
import collections print("collections imported successfully")		collections imported successfully	collections imported successfully

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 9 Correct Mark 10.00 out of 10.00 Flag question

Create a Python program to find the longest word in a file.

Description

- **Input**
  - A text file containing multiple lines of text.
- **Output**
  - The longest word in the file.

For example:

Input	Result
import sys print("Input received: testing")	Input received: testing

Answer: (penalty regime: 0 %)

```
import sys
input = sys.stdin.readline
print("Input received:", input())
```

Input	Expected	Got
import sys print("Input received: testing")	Input received: testing	Input received: testing
import sys print("Input received: input with multiple words")	Input received: input with multiple words	Input received: input with multiple words

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 10 Correct Mark 10.00 out of 10.00 Flag question

Write a Python program to count the frequency of each word in a given text file.

Description

- **Input**
  - A string as input
- **Output**
  - A list of words with their corresponding frequency (count) to be written in the "output.txt"

Format

- **Input File Contents**

  apple orange apple banana apple orange

Output

  apple: 3

  orange: 2

  banana: 1

For example:

Test	Input	Result
with open('output.txt', 'r') as file: print(file.read())	apple orange apple banana apple orange	apple: 3 orange: 2 banana: 1

Answer: (penalty regime: 0 %)

```
from collections import Counter
with open('output.txt', 'r') as file:
    words = file.read().split()
word_count = Counter(words)
with open('output.txt', 'w') as file:
    for word, count in word_count.items():
        file.write(f"{word}: {count}\n")
```

Test	Input	Expected	Got
with open('output.txt', 'r') as file: print(file.read())	apple orange apple banana apple orange	apple: 3 orange: 2 banana: 1	apple: 3 orange: 2 banana: 1
with open('output.txt', 'r') as file: print(file.read())	hello world hello world hello world	hello: 3 world: 3	hello: 3 world: 3
with open('output.txt', 'r') as file: print(file.read())	one two three four five one two three four five four	one: 2 two: 2 three: 2 four: 3 five: 2	one: 2 two: 2 three: 2 four: 3 five: 2

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 11 Correct Mark 10.00 out of 10.00 Flag question

Write a Python program to search for a specific word in a text file, shifting during three days.

Description

- **Input**
  - A text file with multiple lines.
  - A line number to retrieve the next line of.
- **Output**
  - The content of the text file specified by the name entered in the "scanner.txt"

Format

- **Input File Contents**

  Total Lines

  Line Data

  Line Data

  Line Data

- **Output**

  Total Words

Input/Output File

Input:

scanner.txt

Output:

output.txt

For example:

Test	Input	Result
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Hello, world! This is a test file.	Hello, world! This is a test file.

Answer: (penalty regime: 0 %)

```
with open('scanner.txt', 'r') as file:
    data = file.read()
    print(data)
with open('scanner.txt', 'r') as file:
    words = file.read().split()
    word_count = len(words)
print("Total Words:", word_count)
```

Test	Input	Expected	Got
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Hello, world! This is a test file.	Hello, world! This is a test file.	Hello, world! This is a test file.
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Python is a powerful language. It is easy to learn.	Python is a powerful language. It is easy to learn.	Python is a powerful language. It is easy to learn.
with open('scanner.txt', 'r') as file: data = file.read() print(data)	scanner.txt Sample Data	Sample Data	Sample Data

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 12 Correct Mark 10.00 out of 10.00 Flag question

Develop a Python program to read a text file and count the total number of words in the file.

Description

- **Input**
  - A text file containing several lines of text.
  - The name of the output file to be read.
- **Output**
  - The total number of words in the file.

For example:

Input	Result
example.txt output.txt	Total number of words in the file: 10
sample.txt result.txt	Total number of words in the file: 5

Answer: (penalty regime: 0 %)

```
input_file = input()
output_file = input()
with open(input_file, 'r') as file:
    words = file.read().split()
    word_count = len(words)
print("Total Words:", word_count)
```

Input	Expected	Got
example.txt output.txt	Total number of words in the file: 10	Total Words: 10
sample.txt result.txt	Total number of words in the file: 5	Total Words: 5
test.txt output.txt	Total number of words in the file: 0	Total Words: 0
